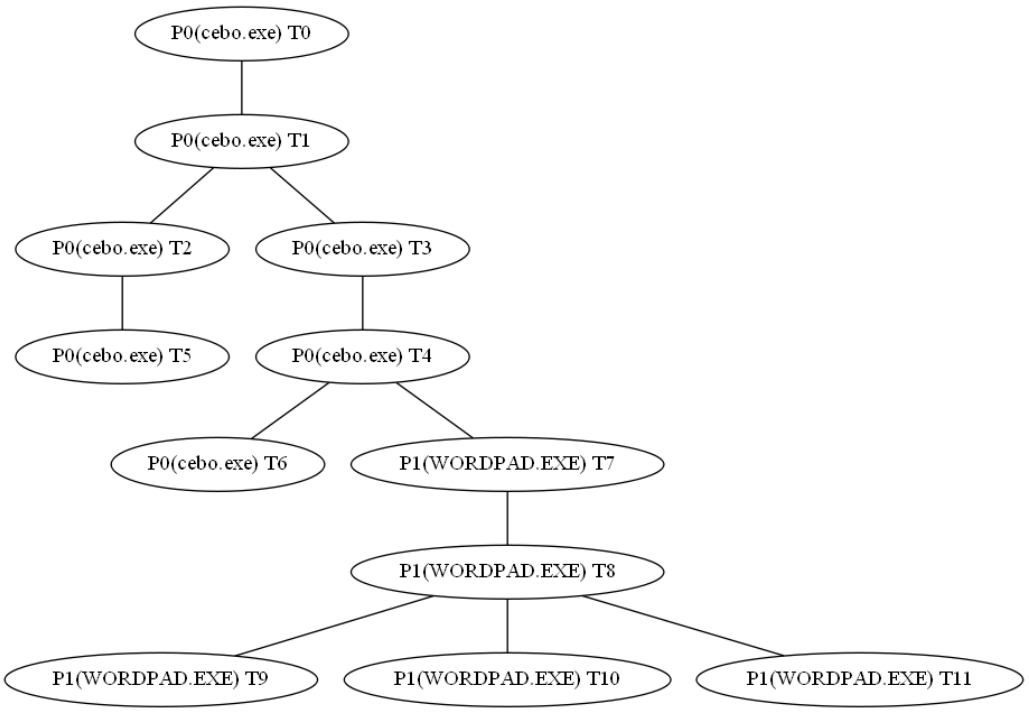
Threads tree

The following tree represents sample's threads. T<index> is an alias for sample's threads (numeration is done in the order of threads creation). P<index> is an alias for processes owning sample's threads.



Running processes

Here it is the list of running processes after sample execution.

Connections and readable network traffic

The analysis environment captures network traffic happened while sample execution. It classifies the traffic and tries to extract the most significant parts from the communications data.

In this section it's possible to find parts of the communication data that are easier to be read.

The current IP address space (IPv4) consists of 4,294,967,298 addresses. Of these addresses some are reserved for private networks (about 18 million) and others for multicast (about 270 million), so in theory there can never be more than 4 billion computers and servers connected to the internet at any given moment. This is a limiting factor since there are about 7 billion people on earth. There is a new addressing schema being implemented (IPv6) that has 340,282,366,920,938,463,463,374,607,431,768,211,456 possible addresses. [...]<h2>[...]Why does my IP address change?</h2>[...]Some providers want to discourage their clients from running a server (mail, ftp, game or other) on their computer and therefore change the public IP address the user gets regularly. Other providers have fewer addresses than they have subscribers and therefore assign a random address to each user when he connects to the internet and assign that same address to another user after he disconnects. Both these processes are usually done by the Dynamic Host Configuration Protocol server (DHCP server). [...]<h2>[...]What would I need my IP address for?</h2>[...]Some people want to run a mail, ftp or game server on their computer and for that software to run it is usually necessary to enter the public IP address currently assigned to the user into the configuration. Other people would like to use a remote desktop application and want to know what IP address to connect to from a remote location. [...]<h2>[...]How does an IP address look?</h2>[...]The currently used IP addresses (IPv4) look like four blocks of digits ranging from 0 to 255 separated by a period like "192.168.0.255".In the new schema (IPv6) addresses can be written in different ways: [...]<ul>[...]<li>[...]2001:2353:0000:0000:0000:0000:1428:57ab</li>[...]<li>[...]2001:2353:0000:0000:0000::1428:57ab</li>[...]<li>[...]2001:2353:0:0:0:0:1428:57ab</li>[...]<li>[...]2001:2353:0::0:1428:57ab</li>[...]<li>[...]2001:2353::1428:57ab</li>[...]</ul>[...]<h2>Hide your IP address</h2>[...]Find out how to easily <a href="http://aff.ironsocket.com/SH7L" target="_blank">hide your IP address</a> via this <a href="http://aff.ironsocket.com/SH7L" target="_blank">link</a>[...] [...] [...] [...] [...] [...]<script type=\'text/javascript\'><!--// <![CDATA[[...]/* [id3] WhatsMyIp.net - Default */[...]OA_show(3);[...]//]]> --></script><noscript><a target=\'_blank\' href=\'http://ads.wsrs.net/www/delivery/ck.php?n=MyIPdb5f512\'><img border=\'0\' alt=\'\' src=\'http://ads.wsrs.net/www/delivery/avw.php?zoneid=3&n=MyIPdb5f512\' /></a></noscript>[...] [...] [...] [...] [...]<a href="mailto:advertise@provaz.eu">Advertise on this site?</a>[...] [...]© 2002 - 2017 <a href="/">WhatsMyIp.net</a>[...]is provided by <a href="http://wsrs.net/" title="WhatsMyIp.net is provided by wsrs.net">wsrs.net</a> | powered by <a href="http://cmsgear.com/" title="powered by cmsGear">cmsGear</a>[...] [...] [...] [...]</body>[...]</html>

Malware processes' network events

The analysis environment tries to capture and collect network actions performed by sample's threads.

Process P0 (cebo.exe)'s network events

- TCP Connect (javi-PC:dynport-> javi-PC:49194 (0))
- TCP Accept (javi-PC:49194 -> javi-PC:dynport (0))

Sample's unpacked / injected modules

In this section it's possible to find information about sample's modules, such as the rich signatures, strings, yara rules matching the module,...

The analysis environment performs an heuristic search trying to find sample's injected or unpacked modules in memory, dumping and analyzing them.

• Module 1 (probably unpacked / injected by the sample)

• Module 1 rich signatures
