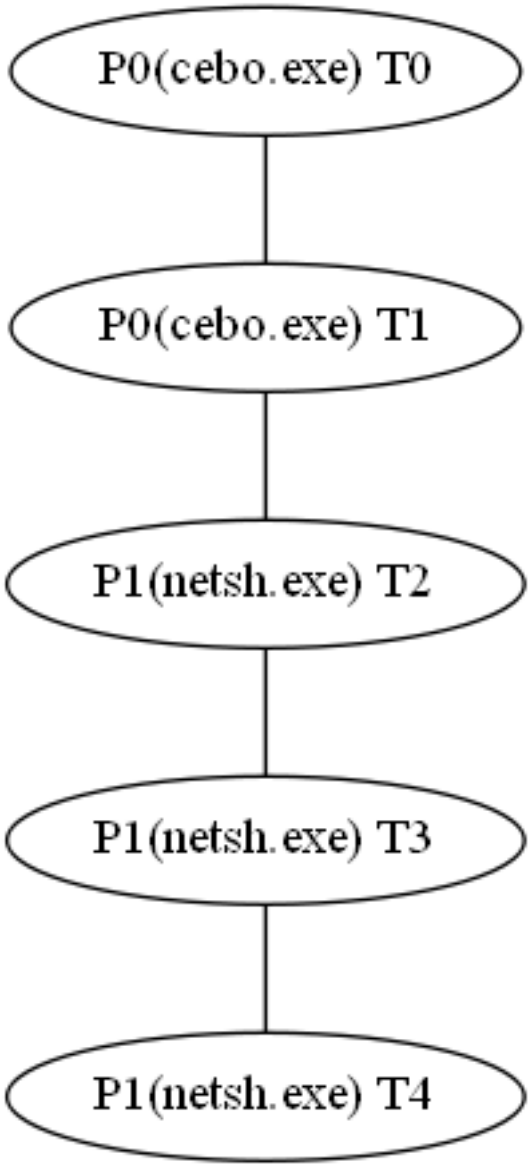
Threads tree

The following tree represents sample's threads. T<index> is an alias for sample's threads (numeration is done in the order of threads creation). P<index> is an alias for processes owning sample's threads.



Running processes

Here it is the list of running processes after sample execution.

Processes with sample' threads

Connections and readable network traffic

The analysis environment captures network traffic happened while sample execution. It classifies the traffic and tries to extract the most significant parts from the communications data.

In this section it's possible to find parts of the communication data that are easier to be read.

Threads behavioural information

In this section it's possible to find information about sample's threads, such as the actions performed by each sample's thread ordered chronologically.

Malware processes' network events

The analysis environment tries to capture and collect network actions performed by sample's threads.

Sample's unpacked / injected modules

In this section it's possible to find information about sample's modules, such as the rich signatures, strings, yara rules matching the module,...

The analysis environment performs an heuristic search trying to find sample's injected or unpacked modules in memory, dumping and analyzing them.
